

Recorded GPU activity during decompression

NVIDIA GeForce RTX 3090 · one warmed, instrumented call per panel · independent time scales · source d323fee21565

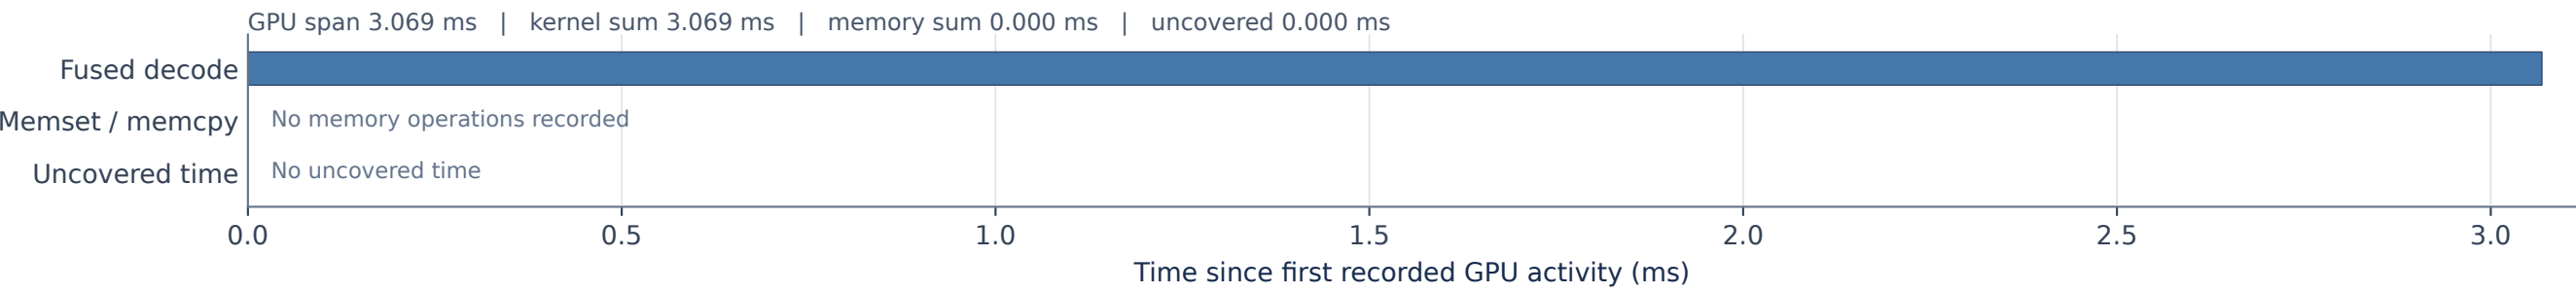

Ascending uint32 · 128 KiB · 29 kernel launches

Normal float32 · 64 MiB · 32 kernel launches

Synthetic text · 64 KiB · 1 kernel launch

Every imported kernel, memset and memcpy interval is shown. Memory operations share a lane; any overlapping intervals remain overlaid.

Uncovered time is the complement of the union of GPU activity intervals; it does not identify a CPU or synchronization cause.

Fused kernels remain indivisible. Trace timings are instrumented diagnostics, not end-to-end benchmarks.

Nsight reports potentially missing CUDA events; plots show recorded activities. Full warnings remain in the report and manifest.
